

IP-HD MODULE

HDTV Recording – A Quantitative Leap in Image Quality

What up till now has been limited to HDTV television and digital photographic cameras is now possible in video surveillance systems – multi-megapixel image formats! A unique combination of multi-megapixel network cameras and hybrid recording software for digital recorders and/or IP cameras enables a degree of exact detail never before attained in CCTV. With this high level of image quality, it is now possible to do without analogue dome cameras in many applications because of the ability to digitally zoom in on live surveillance as well as playback. For example: with a 3 megapixel camera (2048 X 1536 pixels), up to four access lanes at a gas station can be surveyed with an exactness of detail which previously required four analogue cameras. MULTIEYE software for all MULTIEYE recorders, DVR kits and NET software supports the operation of multi-megapixel cameras, for example those from IQeye, Lumenera, Arecont vision.

DESKTOPLOGGER MODULE

With the Desktop Logger (DTL) module and MULTIEYE systems, PC monitors can be kept under remote surveillance optimally. This monitor remote surveillance works on a client-server basis via the network. The DTL software scans, encodes and streams the monitor images via the network to a MULTIEYE system. In the MULTIEYE system, several monitor images are displayed and recorded per second. Recording of the desktop images is done in standard video format in the MULTIEYE system, dependent upon activity; i.e., if no work is being done at a PC, no recordings are made. DTL software supports all monitor resolution formats as well as dual and or quad-monitor operation on a PC.

SOFTWARE ENHANCEMENTS

MULTIEYE-HYBRID & MULTIEYE-NET Licenses

Article no.	Delivery contents
810161	IP-4 License For activation of 4 additional IP video inputs
810415	EX-L4 License For activation of 4 additional analogue video inputs with DVR kits I6200, 32100 and EX-24 set

Enhancement-License
